

Insight Software

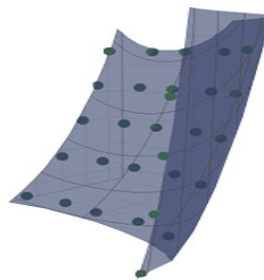

Inflow Control Performance Starts Here

Insight is a powerful CFD based software for optimizing oil and gas production. It allows simulation and analysis of the segregation of oil, water and gas in the annulus of a well, accurately calculating the pressure and flow throughout advanced completions and identifying opportunities for improvement.

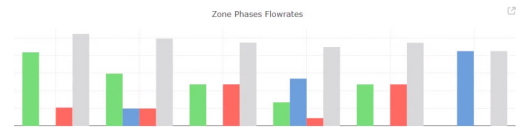

Single Zone Understand

Explore the effects of oil, water and gas segregation and dynamic valve interactions.

Upscale

Zone inflow control performance for use in reservoir simulators or Insight Multizone.

Multi Zone Optimize

Quality assure and automatically optimize inflow control applications.

Key Features

- Transient modeling of oil, water and gas segregation and valve interaction in the annulus of the wellbore.
- Simulate and upscale behavior of any inflow control completed wellbore.
- Design wells with accelerated and increased oil recovery.
- 1,000,000x faster than commercial CFD software.
- Interactive 3D visualization of flow in wellbore.
